Here and throughout the presentation, a lot of ideas are attributable to Filaseta, Huxley, Konyagin, Sargos, Steger, Swinnnerton-Dyer and Trifonov.

Introduction	
000000	

Corollary

Assume that the inequality

$$\left|\alpha_n - \frac{r}{s}\right| \le \frac{1}{s^2}$$

holds for some integers $r \in \mathbb{Z}$ and $s \in [1, X^n]$ with gcd(r, s) = 1. Then,

$$\mathcal{S} \ll_{n,\epsilon} \delta^{\frac{2}{n(n+1)}} X + \frac{X}{s^{1/n}} + X^{\epsilon}$$

イロト 不得 トイヨト イヨト 二日

for each $\epsilon > 0$. For n = 1 the third term can be replaced by 1.

Patrick Letendre Laval University

000000 •000	000000

Sketch of the proof of the theorem

Lemma

Let $M_1 = (x_1, y_1), \dots, M_{n+2} = (x_{n+2}, y_{n+2}) \in \Gamma_{\delta} \cap \mathbb{Z}^2$ be ordered points according to $x_1 < \dots < x_{n+2}$. Set $\begin{vmatrix} 1 & x_1 & x_1^2 & \cdots & x_1^n & y_1 \end{vmatrix}$

$$\Lambda(M_1,\ldots,M_{n+2}) := \begin{vmatrix} \vdots & \vdots & \vdots & \vdots \\ 1 & x_{n+2} & x_{n+2}^2 & \cdots & x_{n+2}^n & y_{n+2} \end{vmatrix}$$
Then, there are two preciditions

Then, there are two possibilities:

(i)
$$\Lambda(M_1, \dots, M_{n+2}) \neq 0$$
 in which case
 $|x_{n+2} - x_1| \geq \left(\frac{1}{(n+2)\delta}\right)^{\frac{2}{n(n+1)}},$

(ii) $\Lambda(M_1, \ldots, M_{n+2}) = 0$ in which case all the points are on a polynomial curve $\mathcal{C} := \{(x, y) \in \mathbb{R}^2 : y = P(x), \deg P(x) \leq n, P(x) \in \mathbb{Q}[x]\}.$

Patrick Letendre Laval University

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Proofs	
000	

Sketch of the proof of the corollary

- We apply the theorem. Only the contribution of the exceptionnal polynomial has to be estimated.
- We distinguish 3 separated cases:

(1)
$$q \gg \frac{1}{\delta}$$
,
(2) $q \ll \frac{1}{\delta}$ and $|f(x) - P(x)| \ll \frac{1}{q}$ for each $x \in [X, 2X]$,
(3) $q \ll \frac{1}{\delta}$ and $|f(z) - P(z)| \gg \frac{1}{q}$ for a $z \in [X, 2X]$.

Patrick Letendre Laval University

(3) $q \ll \frac{1}{\delta}$ and $|f(z) - P(z)| \gg \frac{1}{q}$ for a $z \in [X, 2X]$.

• The conclusion follows quite easily.

Patrick Letendre Laval University The number of integer points close to a polynomial

		Work in progress
000000	0000	00000

By considering n + 1-tuples of integer points in $\Gamma_{\delta} \cap \mathbb{Z}^2$, we establish the combinatorial inequality

$$\mathcal{S} \ll_{n,\epsilon} \frac{X}{A} + \sum_{a_1,\dots,a_n=1}^A t(a_1,\dots,a_n) + \mathcal{M}_{\epsilon}$$

where $t(a_1, \ldots, a_n)$ counts the number of points x with $(x, y) \in \Gamma_{\delta} \cap \mathbb{Z}^2$ such that

$$(x+a_1, y_1), (x+a_1+a_2, y_2), \dots, (x+a_1+\dots+a_n, y_n) \in \Gamma_{\delta} \cap \mathbb{Z}^2$$

with not all (the n + 1) of them on a polynomial of degree at most n - 1. \mathcal{M}_{ϵ} counts the contribution of sequences of ordered points in $\Gamma_{\delta} \cap \mathbb{Z}^2$ that are all on a polynomial of degree at most n - 1.

	Work in progress

It can be shown, as previously, that

$$\mathcal{M}_{\epsilon} \ll_{n,\epsilon,\epsilon_0} \delta^{\frac{1}{n-1}-\epsilon} X + \frac{X}{q^{\frac{1}{n-1}}} + X^{\epsilon_0}$$

where q is the denominator of some rational approximation of the leading term α_n .

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

	Work in progress

From there, the idea is to fix (a_1, \ldots, a_n) and to consider two consecutive points in $x, x + b \in t(a_1, \ldots, a_n)$.

Patrick Letendre Laval University The number of integer points close to a polynomial ・ロト ・日 ・ ・ ヨ ・ ・ ヨ ・ うへぐ

	Work in progress
	00000

From there, the idea is to fix (a_1, \ldots, a_n) and to consider two consecutive points in $x, x + b \in t(a_1, \ldots, a_n)$. We write

$$d_{0} := 0, \ d_{1} := a_{1}, \ d_{2} := a_{1} + a_{2}, \dots, \ d_{n} := a_{1} + \dots + a_{n},$$
$$D_{k} := \prod_{\substack{0 \le i < j \le n \\ i, j \ne k}} (d_{j} - d_{i}), \quad D_{k,l} := \prod_{\substack{0 \le i < j \le n \\ i, j \ne k, l}} (d_{j} - d_{i}),$$
$$e := gcd(D_{0}, \dots, D_{n}),$$
$$D_{s} := \max_{j} D_{j}, \quad D_{s,t} := \max_{j \ne s} D_{s,j}.$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

Patrick Letendre Laval University

	Work in progress

Some well known arguments lead us to the identity

$$nbe\alpha_n = c + 2n\theta \frac{\delta e D_{s,t}}{D_s}$$

where b is considered as the variable that makes the term $nbe\alpha_n$ close to an integer c.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

	Work in progress

Some well known arguments lead us to the identity

$$nbe\alpha_n = c + 2n\theta \frac{\delta eD_{s,t}}{D_s}$$

where b is considered as the variable that makes the term $nbe\alpha_n$ close to an integer c.

We are thus led to estimate sums over (a_1, \ldots, a_n) that contains e:

$$\sum_{a_1,...,a_n=1}^{A} gcd(e,q), \ \sum_{a_1,...,a_n=1}^{A} e \text{ and } \sum_{a_1,...,a_n=1}^{A} \frac{eD_{s,t}}{D_s}$$
